## **Working Prototype & Known Problems Report**

### **Application Bugs and Defects:**

1. When a user adds more classes than the width of the “Classes Currently Teaching” box, extra classes overflow beyond box borders.
2. When clicking on the “Profile” button, server is sometimes unable to fetch a user’s profile in a timely manner, redirecting user back to the home page.
3. After a user adds a class to their “Courses Currently Teaching,” that class is not removed from the latter queries.
4. When adding classes in “Courses Currently Teaching,” pressing “Update Account” or “Create Account” before query has loaded results in account updating/creating, but does not clear query result.
5. User can use <spacebar> to remove classes in “Courses Currently Teaching” (intentional).
6. A user must wait for the query to load before selecting their class in both “Your Profile” and “Create Account”
7. Clicking ‘back’ button on the browser does not undo the information input in the database, but it clears the form, making it unclear for the user whether his changes have been wiped out of the database as

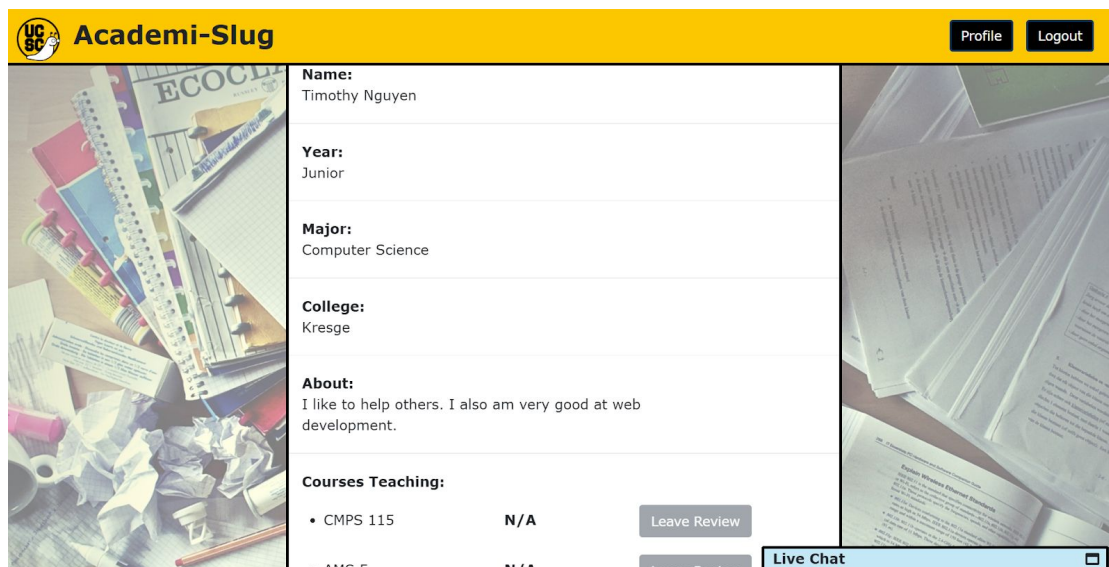

well (they were not and the website will yield an error at update attempt).

8. When searching for classes, the user must include a space between the course index and the course number. Any other variations will fail, causing the user to be redirected to the homepage.
9. Website elements may be misaligned/shifted due to viewport variations (screen resolutions) in web development (e.g. 1920x1080).

10. Not all classes from the UCSC class search ([https://pisa.ucsc.edu/class\\_search/index.php](https://pisa.ucsc.edu/class_search/index.php)) are available when modifying courses in “Your Profile” and “Create Account” (i.e AMS 147).
11. Chat is only available when both users are active.
12. Navigation bar search engine does not use predictive type (intentional).

13. Pressing 'Sort By' on the results page jumps user back to top of the page.
14. Alert is missing after a user has submitted their review.
15. Alert is also left-aligned, rather than centered.
16. When viewing a guest's profile, background does not expand, causing very large cards to overlap with navigation bar. Must use secondary-division scrolling to view entire card (or zoom the page out).

17. When viewing another user's profile, thisUser must use the main search function, as no history tracking is implemented.
18. Small split-second visual glitch when user logs in.

19. In general, application is not very secure.
20. Some tests may not work correctly and/or may be evergreen.
